

FSUIPC: Lua Tutorial For Microsoft

Flight Simulator and GoFlight Equipment

[Home](#)[About Lua](#)[Executing Code](#)[Binary](#)[Hexadecimal](#)[Bits & Bytes](#)[Memory Offsets](#)[Variables](#)[The Code](#)[The Editor](#)[Get Started](#)[FlightSim](#)[Cleaning Up](#)[Assignments](#)

The Editor

The use of an Editor is completely up to you. If you've never used one before for programming. I suggest starting with plain old, Microsoft's Notepad.exe. Heck, you already have it! When you've had enough of wasting your time trying to fix miss-spellings, then you should think about an Editor.

I started using LuaEdit. I kept having problems with it deleting my whole directory. No more, thanks. In the Lua for Beginners website, there's a page called [Different Editors](#). That's where I found Notepad++.

The down side to choosing your editor is I can't help you with it.

The upside to choosing an editor it will help you catch errors before running the program.

Are you ready to start playing with some code?
